

Parallel Programming and Optimization with Intel® Xeon Phi™ Coprocessors

Intel is offering an updated and expanded series of software developer trainings in parallel programming using the Intel® Xeon Phi™ coprocessors

This series of offerings provides software developers the foundation needed for modernizing their codes to extract more of the parallel compute performance potential found in both Intel® Xeon® processors and Intel Xeon Phi coprocessors.

The courses contain materials and practical exercises appropriate for developers beginning their journey to parallel programming, as well as provide cutting-edge detail to HPC experts on the best practices for Intel's multicore and many-core architectures and software development tools. The offerings include a one-day introductory seminar (CDT 101, free), and a one-day hands-on laboratory (CDT 102, free).

The training targets software engineers and architects, and covers the following topics:

- Intel Xeon Phi architecture: purpose, organization, pre-requisites for good performance, future technology
- Programming models: native, offload, heterogeneous clustering
- Parallel frameworks: automatic vectorization, OpenMP, MPI
- Optimization methods: general, scalar math, vectorization, multithreading, memory access, communication and special topics

For more information and to register for a workshop in your area, use the QR code or visit: <http://tinyurl.com/2015ParallelProgrammingSeries>

Event Details:

Date: CDT 101: August 18, 2015
CDT 102: August 19, 2015

Registration: 8:30 AM

Presentation: 9:00 AM to 4:00 PM

Location: Colorado State University
Lory Student Center—Room 300
1101 Center Ave Mall
Fort Collins, CO 80521
